

Care Home Organisations Implementing Cultures of Excellence

The CHOICE research project used in-depth case studies of care homes for older people to investigate the relationship between the organisational culture of the home and the quality of care experienced by residents.

Rationale for the study:

- Care homes with similar resources and demands are seen to provide vastly different experiences of care to their residents
- 'Organisational culture' is thought to play an important role in shaping the care experience
- Finding out what 'organisational culture' means in terms of the day-to-day practices of care homes.

Methods used for the study:

- 11 in-depth case studies of care homes
- Observations of care for residents with advanced dementia and complex needs using the PIECE-Dem observational framework
- Broader observations of day-to-day life in the home
- Interviews with staff, residents and visitors to the home
- Analysis within and between case studies to establish key practices and cultural elements influencing care experiences

About the Association for Dementia Studies:

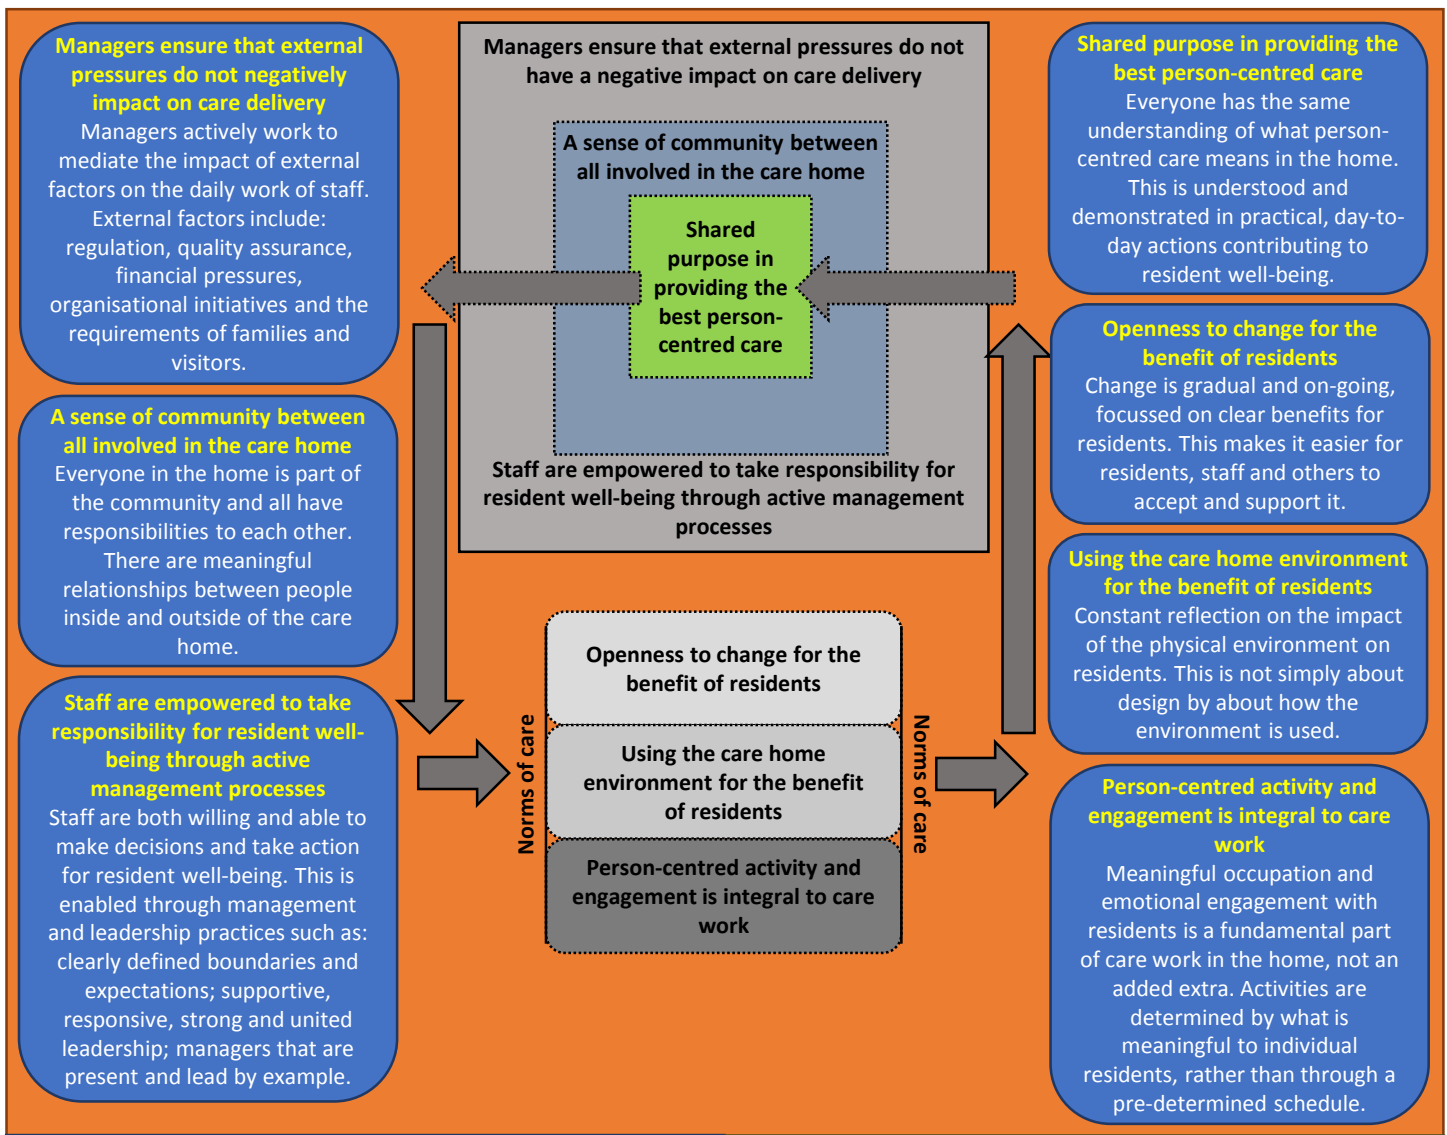

The Association for Dementia Studies is an active research and education centre. Our multi-professional team are experts in the field of person-centred dementia care and support.

Through research, education, consultancy and scholarship, we make a cutting-edge contribution to building evidence-based practical ways of working with people living with dementia and their families that enables them to live well.

Positive care cultures evidenced:

- Shared values and assumptions about care delivery
- Norms of care consistent with values
- All 7 elements present, although working in different ways in different homes
- Poor care experiences unusual, infrequent and often counteracted by other elements of culture

Inconsistent or negative care cultures evidenced:

- Lack of shared values and assumptions about care delivery
- Inconsistent norms of practice
- Fragmentation of culture in which some, but not all, of the 7 elements were present
- Positive care experience occurring, but dependent on individual staff and often undermined by absence of certain elements of culture

This research was funded through the PANICOA programme by the Department of Health and Comic Relief. The views expressed in this summary are those of the authors and do not necessarily reflect those of the Department of Health or Comic Relief.
